Active Directory Access Reviews & Certification

CONTROLLED LAB TEST COMPLETE • Remaining owner reviews pending

PROJECT OBJECTIVE

Inventory departmental Active Directory group memberships, document access certification decisions, identify excess access, and validate targeted remediation using least-privilege principles.

IMPLEMENTATION & VERIFIED RESULTS

Departmental group inventory	4 groups reviewed: Finance, HR, IT, Helpdesk
Membership export	9 membership records captured
Certification decisions	Test account: Finance = Revoke; IT = Approve
Access remediation	Inappropriate Finance membership removed
Post-remediation validation	Appropriate IT membership retained
Remaining owner reviews	7 records pending review
Fresh-logon SMB permissions retest	Not tested

EVIDENCE & SKILLS DEMONSTRATED

Preserved a nine-row pre-remediation membership register and validated the targeted group-membership change. Skills demonstrated: Active Directory group inventory, access governance, certification decisions, least-privilege remediation, before-and-after verification, and CSV-based evidence handling.

OPEN FOLLOW-UP ITEMS

Seven membership records still require access-owner decisions. A fresh-logon SMB permission retest was not performed and remains optional follow-up validation.

SCOPE NOTE

Completion refers to the controlled access-certification test and verified remediation only; it does not imply full certification of every inventoried membership or completion of SMB permission testing.
