Identity Lifecycle Management — Joiner, Mover & Leaver

CONTROLLED LAB IMPLEMENTATION AND VALIDATION COMPLETE | October 2026

PROJECT OBJECTIVE

Demonstrate controlled identity provisioning, department transfers, and offboarding in Active Directory, alongside limited helpdesk password-reset delegation and targeted account-lockout testing.

IMPLEMENTATION & VERIFIED RESULTS

Control / Activity	Verified result
Delegated helpdesk reset	helpdesk01 reset mreed; password change at next logon confirmed
Helpdesk group restrictions	Finance group Add/Remove disabled in ADUC under helpdesk session
Fine-grained password policy	Test account lockout threshold of 3 verified
Account lockout test	Three incorrect attempts led to LockedOut=True
Account unlock	Access restored; manual-versus-automatic unlock timing not established
Joiner — Finance	jtaylor provisioned; Finance access allowed, HR browse denied
Mover — Finance to HR	OU, department and group changed; HR access allowed, Finance denied
Leaver — Offboarding	jtaylor disabled, moved to Disabled Accounts; new sign-in denied (1327)

EVIDENCE & TECHNICAL DELIVERABLES

Captured screenshots of joiner, mover, and leaver directory states and access tests. Documentation includes an implementation guide, access matrix, observed test results, security notes, evidence index, and read-only verify-jml.ps1 script.

LIMITATIONS & FOLLOW-UP

A post-transfer whoami /groups capture still displayed an old Finance SID; token/session refresh warrants investigation. The unlock result does not independently establish that the helpdesk action, rather than automatic expiry, caused restoration. Relevant Windows Security event logs were not provided for this project. AD disablement does not revoke every pre-existing or cloud session.

SKILLS DEMONSTRATED

Joiner-mover-leaver workflows, delegated administration, Active Directory group changes, fine-grained password policies, access validation, least-privilege testing, and offboarding controls.

ASSESSMENT SCOPE

Results reflect a controlled training environment and the documented test cases; they do not represent a production deployment or formal security certification.
