Active Directory Security Auditing & Monitoring

CORE REPORTING DELIVERABLE: COMPLETE / TESTED | Lab: corp.example.test | IAM-DC01

PROJECT OBJECTIVE

Demonstrate read-only investigation of Active Directory security events and automated export of audit evidence through a PowerShell-generated HTML dashboard and CSV reports.

IMPLEMENTATION & VALIDATED RESULTS

Control / output	Verified result
Audit collection	173 Security event records exported
Triage candidates	48 records flagged for analyst review
Event coverage	9 monitored event categories
Report outputs	HTML dashboard; detailed events, findings, and summary CSVs
Report execution	Get-IAMAuditReport.ps1 ran on IAM-DC01; HTML dashboard opened
XML extraction	Corrected PowerShell XML field extraction using InnerText
Time window	Rolling seven-day reporting snapshot

FLAGGED EVENT CATEGORIES

4724 Password reset attempted: **19** | 4726 User deleted: **11** | 4728 Group member added: **15** | 4729 Group member removed: **2** | 4740 Account lockout: **1**

INVESTIGATION EVIDENCE

Event 4740 identified lockout.test01 and caller workstation IAM-MGMT01. Event 4729 showed Jordan Taylor removed from GG_HR_Users by Administrator. Eleven deletion records initiated by Administrator were identified for further authorization review.

SKILLS & ARTIFACTS

Windows Security auditing, Get-WinEvent, PowerShell XML parsing, actor/target attribution, HTML dashboard generation, CSV reporting, and reproducible evidence validation. Artifacts: Get-IAMAuditReport.ps1, IAM-Audit-Dashboard.html, IAM-Audit-Events.csv, IAM-Audit-Findings.csv, and IAM-Audit-Summary.csv.

SCOPE & OUTSTANDING REVIEW

Reporting and export functionality was tested successfully. The 48 flagged records still require analyst classification; their presence does not establish unauthorized activity. Individual authorization of deletion events remains unverified.
