Project 07 — Project Completion Sheet

Status: Assessment complete | Date: 27 October 2026 | Domain: corp.example.test

Project overview

Project 07 — IAM Security Assessment and Audit Capstone. Environment: corp.example.test; IAM-DC01 domain controller; IAM-MGMT01 management workstation. Assessment completed 27 October 2026.

Objectives

Assess identity inventory, role-based access, password policies, privileged access, security auditability, and document remediation risks.

Implementation and validation

Phase 1: inventoried IAM-Lab identities. Phase 2: reviewed nine membership records across Finance, HR, IT, Helpdesk and IAM operator groups; no department mismatches or disabled members in the reviewed set. Phase 3: evaluated domain and fine-grained password policies. Phase 4: reviewed privileged groups and delegated accounts. Phase 5: collected 204 security audit events across nine event types in a seven-day window. Phase 6: created a three-finding risk register. Phase 7: verified evidence exports and generated SHA-256 integrity manifest.

Assessment findings

IAM-07-001 (Medium, Open): default domain minimum password length is 7; review stronger password policy. IAM-07-002 (Medium, Open): default domain lockout threshold is 0; review lockout, monitoring and denial-of-service tradeoffs. IAM-07-003 (High, Open): built-in Administrator password never expires; restrict routine use and document rotation and compensating controls. Severity ratings are preliminary, and no remediation has been verified.

Evidence inventory

Domain-Password-Policy.csv — 1 record; Fine-Grained-Password-Policies.csv — 1 record; Privileged-Group-Inventory.csv — 4 records; Security-Audit-Events.csv — 204 records; IAM-Risk-Register.csv — 3 records; Evidence-Integrity-Manifest.csv — five SHA-256 hash entries. Evidence resides on IAM-DC01 at C:\IAM-Project07\Evidence. Actual CSV files and hashes are not included in this document.

Results and limitations

The selected group review found no mismatches; the privileged group export listed Administrator in four privileged groups; the security log contained the specified audit events. This is a lab-scope assessment, not a complete domain-wide security audit. Hashes support subsequent integrity comparisons but do not independently authenticate the evidence.

Lessons learned

Use least-privilege delegation; verify effective group membership and password policies; distinguish successful evidence export from risk remediation; keep audit records and integrity hashes together; separate test accounts from production identities.

Project sign-off

Implementation and evidence validation: COMPLETE. Findings remediation: OPEN (3).
